STARCK is an AI token deployed on the Binance Smart Chain which monitors and analyzes Equity Markets, Commodity markets, Forex, Cryptocurrencies. Starck's team is developing AI Starck Investment Platform to monitor, analyze and send news about upcoming ups or downs in the trends of selected assets such as: commodities, equity, forex and cryptocurrencies. AI Starck Investment Platform is an innovative and powerful tool that is developed to help traders and investors get instant prices, news, analysis and tracking of a complete investment portfolio.

Owner privileges

Crucial issues found

The contract does contain issues of high or medium criticality. In some circumstances, the Contract may not function as intended and may pose a safety risk.

Contract owner cannot mint

It is not possible to mint new tokens.

Contract owner cannot blacklist addresses.

It is not possible to lock user funds by blacklisting addresses.

Contract owner cannot set high fees

The fees, if applicable, can be a maximum of 25% or lower. The contract can therefore not be locked. Please take a look in the comment section for more details.

Token transfer can be locked

Owner can lock user funds with owner functions.

Token cannot be burned

There is no burn function within the contract.

Ownership is not renounced

Contract can be manipulated by owner functions.

Comments

Ownership Privileges

- The owner can pause/un-pause token transfer for an indefinite period of time.

Note - This Audit report consists of a security analysis of the **Starck** smart contract. This analysis did not include functional testing (or unit testing) of the contract's logic. Moreover, we only audited one token contract for the **Starck** team. Other contracts associated with the project were not audited by our team. We recommend investors do their own research before investing.

Audit Scope

This audit covered the following files listed below with a SHA-1 Hash. The above token Team provided us with the files that needs to be tested.

We will verify the following claims:

- Correct implementation of Token standard
- Deployer cannot mint any new tokens
- Deployer cannot burn or lock user funds
- Deployer cannot pause the contract
- Overall checkup (Smart Contract Security)

The auditing process follows a routine series of steps:

- Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
- Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
- Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.
- Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
- Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
- Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
- Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.

 STARCK.sol

f07e682be8291c6eda5e14449ed7126ca766cea6

Audit Details

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Medium Issues

#1 ISSUE ⓘ

⌚ Pending

The owner lock tokens.

STARCK.SOL

L937-939

DESCRIPTION

The contract contains the pausable functionality, which can lock the token transfer for an indefinite period, which is not recommended as there must be a locking period in the contract so that the token transfer is not locked. Add a locking period in the contract so that the tokens are not locked for an indefinite period of time.

Low Issues

#1 ISSUE ⓘ

⌚ Pending

Floating pragma solidity version.

STARCK.SOL

L6

DESCRIPTION

Adding the constant version of solidity is recommended, as this prevents the unintentional deployment of a contract with an outdated compiler that contains unresolved bugs.

Informational Issues

#1 ISSUE ⓘ

⌚ Pending

Functions that are not used (dead-code)

STARCK.SOL

L188-190

DESCRIPTION

Remove unused functions.

Optimization Issues

#1 ISSUE ⓘ

⌚ Pending

Public function that could be declared external (external-function)

STARCK.SOL

L269-271 L277-282 L584-586 L592-594 L616-618 L623-625
L635-639 L658-662 L680-685 L899-901 L914-917 L937-939
L941-943

DESCRIPTION

Use the `external` attribute for functions never called from the contract.

Disclaimer

SolidProof.io reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc’...)

SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof’s position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.
